

ABSTRACT

The present dispenser tip attaches to a container and may include a separately formed base, first and second member, and cap. The base may be threadably attached to the container. The first member may include a flange, a basal portion and an extension. The  
5 flange may engage an inner surface of the base. The basal portion and the extension may engage to define a pathway for a flowable material being dispensed from the container. The second member may be disposed about the extension and may be connected to the cap by a hinge. The cap may include a stopper element and a rib or groove to seal the dispenser when the cap is in a closed position.
